METALEX Ready to Use.

Making Best Practice Easy

METALEX

When it comes to the construction sector, regulations, best practice and ease of application are not always words that sit well together.

So when the term 'Best Practice' was rolled out, in conjunction with the requirements of the NZ Building code (around timber envelope treatments) many were right to be a little uneasy as to what was being suggested. On closer inspection, what has become clear is that the changes are simple and with the right products, easy to implement at a fabrication level.

The changes have placed a high level of importance on the fabricator to ensure that the area of the liner exposed to potential moisture receives the required protection as stated in the NZ Building code. This isn't a ground breaking evolution for the industry, indeed far from it for those of us that appreciate the long term value of doing the right thing. But, it did serve to provide a timely reminder to all fabricators of the need to follow best practice approaches or suffer the consequences.

When it comes to delivering these treatments to Building Code standard, in a user friendly and easy manner, there is no better product to use than the latest addition to the long established Metalex family of products.

Metalex 'Ready To Use' end seal treatment is an all new formulation (available in green and clear options). As the name suggests, it comes out of the tin ready for application and is designed specifically with the aluminium joinery industry in mind. It is billed as a simple solution for the "Envelope Treatment" of the H3.1 timber liners and reveals used in window manufacture, ensuring the reveals are protected from moisture uptake and fungal attack where they have been end/mitre cut and ripped.
